## 1 MASON'S GAIN FORMULA

## 2 BODE PLOT

### 2.1 Introduction

### 2.2 Example

## 3 SECOND ORDER SYSTEM

### 3.1 Damping

### 3.2 Example

## 4 ROUTH HURWITZ CRITERION

### 4.1 Routh Array

### 4.2 Marginal Stability

### 4.3 Stability

## 5 STATE-SPACE MODEL

### 5.1 Controllability and Observability

### 5.2 Second Order System

## 6 NYQUIST PLOT

## 7 PHASE MARGIN

## 8 GAIN MARGIN

## 9 COMPENSATORS

### 9.1 Phase Lead

## 10 OSCILLATOR

10.1. A unity feedback control system is characterised by the open-loop transfer function

$$G(S) = \frac{2(s+1)}{s^3 + ks^2 + 2s + 1} \quad (10.1.1)$$

the value of the  $k$  for which the system oscillates at 2 rad/s

**Solution:** Modelling Closed loop system  $G(s)$  into a Open loop system  $G_m(s)$

$$E(s) = R(s) - H(s)Y(s) \quad (10.1.2)$$

$$G(s) = \frac{Y(s)}{E(s)} \quad (10.1.3)$$

$$G(s) = \frac{Y(s)}{R(s) - H(s)Y(s)} \quad (10.1.4)$$

$$G_m(s) = \frac{Y(s)}{R(s)} = \frac{G(s)}{1 + H(s)G(s)} \quad (10.1.5)$$

Characteristic equation :

$$1 + G(s)H(s) = 0 \quad (10.1.6)$$

For a unity feedback system ,  $H(s) = 1$

$$1 + G(s) = 0 \quad (10.1.7)$$

$$1 + \frac{2(s+1)}{s^3 + ks^2 + 2s + 1} = 0 \quad (10.1.8)$$

$$s^3 + ks^2 + 4s + 3 = 0 \quad (10.1.9)$$

For the system to oscillate poles should lie on imaginary axis. Constructing the routh array for the characteristic equation(10.1.9).

$$\begin{array}{c|cc} s^3 & 1 & 4 \\ s^2 & k & 3 \\ s^1 & \frac{3-4k}{k} & 0 \\ s^0 & 3 & 0 \end{array} \quad (10.1.10)$$

For the system to have poles on imaginary axis, any one of the entire row in a Routh's matrix should be all zeros.

$$\frac{3-4k}{k} = 0 \text{ or } k = \frac{3}{4} \quad (10.1.11)$$

substituting value of k in (10.1.9).

$$s^3 + \frac{3}{4}s^2 + 4s + 3 = 0 \quad (10.1.12)$$

$$s = \frac{-3}{4}, +2j, -2j \quad (10.1.13)$$

This show that at  $k = 3/4$ , system oscillates at frequency 2 rad/s.

10.2. Finding the system response  $g_m(t)$  in time domain

**Solution:** From equation (10.1.5)

$$G_m(s) = \frac{2(s+1)}{s^3 + \frac{3}{4}s^2 + 4s + 3} \quad (10.2.1)$$

Partial Fractions

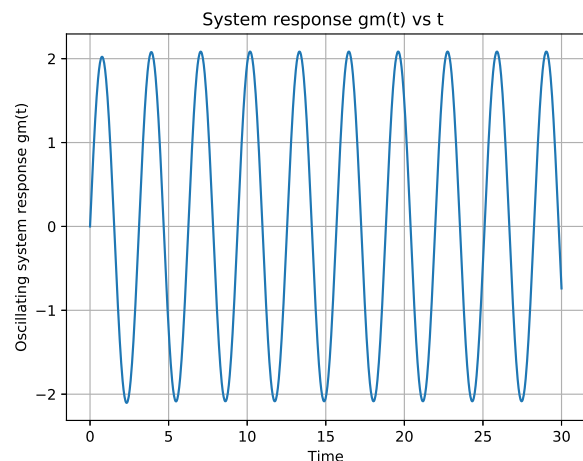

$$G_m(s) = \frac{8}{73(s + \frac{3}{4})} + \frac{-8s + 152}{73(s^2 + 4)} \quad (10.2.2)$$

Apply inverse Laplace transform

$$g_m(t) = \frac{8}{73}e^{-\frac{3t}{4}}u(t) + \left(\frac{-8}{73}\right)\sin(2t) + \left(\frac{-152}{73}\right)\cos(2t) \quad (10.2.3)$$

10.3. Plotting  $g_m(t)$  in time domain.

[https://github.com/varunsankarmoparthy/EE2227-CONTROLSYSTEMS/blob/master/codes/EE18BTECH11030\(1\).py](https://github.com/varunsankarmoparthy/EE2227-CONTROLSYSTEMS/blob/master/codes/EE18BTECH11030(1).py)

This shows that system oscillates at 2 rad/sec.

10.4. Verifying  $G_m(s)$  using Rouths array

[https://github.com/varunsankarmoparthy/EE2227-CONTROLSYSTEMS/blob/master/codes/EE18BTECH11030\(2\).py](https://github.com/varunsankarmoparthy/EE2227-CONTROLSYSTEMS/blob/master/codes/EE18BTECH11030(2).py)

This shows that system is oscillating and stable.
